## VOLUME III—MARRIAGE AND DIVORCE

A brief summary of the contents for each section is listed below for the convenience of the reader. A complete table of contents is shown at the beginning of each section and is identified by a narrow black edge which can be located easily by fanning the pages. Each section is paged independently, using the section number as the identifying prefix.

### Section 1. Marriages

#### For the United States:

National trend data.

Marriage totals and rates for each State, division, and region and the 50 largest SMSA's.

Marriage totals for each county or county equivalent.

Monthly marriage totals for each State, division, and region.

#### For the marriage-registration area:

Marriages classified by major demographic characteristics of bride and groom and by characteristics of marriage performed in each participating State; marriage rates specific for sex, age, and previous marital status.

### Section 2. Divorces

#### For the United States:

National trend data.

Divorce totals and rates for each State, division, and region and the 50 largest SMSA's.

Divorce totals for each county or county equivalent.

Trend of national estimates of the total number of children involved in divorce.

#### For the divorce-registration area:

For each participating State, divorces classified by major demographic characteristics of husband and wife, characteristics of their marriage, and number of children.

### Section 3. Puerto Rico and Virgin Islands (U.S.)

Marriage and divorce totals for each county or county equivalent.

Marriages classified by major demographic characteristics of bride and groom.

For Virgin Islands only, divorces and annulments classified by characteristics of husband and wife, duration of marriage, and number of children.

### Section 4. Technical Appendix

Historical and contemporary sources of marriage and divorce statistics, design of the samples of marriages and divorces and annulments, variability of sample estimates, and uniformity and completeness of the reporting forms and the collected data. Tables of the population estimates used as bases for rates.

## Sampling Variability of the Marriage Statistics

In the tables which present statistics based on data from probability samples of marriage records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-7 in the Technical Appendix. It is suggested that any number smaller than those shown below be interpreted simply as "small" rather than any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

SECTION 1 — MARRIAGES

Table 1-7. Marriage Rates by Previous Marital Status and Age of Bride and Groom: Marriage-Registration Area, 1983-84

[Based on sample data. Marriages of persons under 15 years of age are included in the total and in the youngest age group. Rates are marriages per 1,000 male and female populations of specified age and previous marital status residing in area. Figures exclude data for Iowa. Figures for widowed and divorced, but not all previously married, exclude data for Michigan, Ohio, and South Carolina. Figures for all marriages include previous marital status not stated; previously married include widowed or divorced not stated.]

## Sampling Variability of the Divorce Statistics

In the tables which present statistics based on data from probability samples of divorce records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-8 in the Technical Appendix. It is suggested that any number smaller than those shown below be interpreted simply as "small" rather than any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

# NOTES

## **Reporting areas**

Marriage data are shown for both Puerto Rico and the Virgin Islands. Divorce totals are shown for both Puerto Rico and the Virgin Islands and detailed divorce statistics for the Virgin Islands only.

## **Geographic classification**

Data are shown by place of occurrence. Totals are shown for the local areas of St. Croix Island and St. Johns and St. Thomas Islands (the latter two combined) in the Virgin Islands and for the primary geographic subdivisions, "municipios," in Puerto Rico. Courts empowered to grant divorces are located only in a few municipios in Puerto Rico; residents of other municipios obtain divorces in these courts.

## **Race and color**

For 1984, brides and grooms are not shown by race or color for either Puerto Rico or the Virgin Islands. Husbands and wives divorced in 1984 are classified as white or all other for the Virgin Islands.

Section 4—the Technical Appendix—includes information about the sample specifications, sampling errors, and completeness of reporting for these statistics.

## SECTION 4 — TECHNICAL APPENDIX

### SOURCES OF DATA

Marriage and divorce statistics in this volume are based on information from two sources: (1) Complete counts of events obtained from all States and (2) data on characteristics from marriage and divorce certificates from States meeting certain reporting criteria.

State and local officials annually provide complete counts of marriages and divorces by county of occurrence, the number of annulments granted in each State, and marriages by month of occurrence. From these counts marriage and divorce totals are derived. Rates are computed for each State, geographic division, region, registration area, and for the United States.

Data on marriages and divorces and of the persons involved for the States that constitute the marriage-registration area (MRA) and the divorce-registration area (DRA) are based on information from two sources. For some States, samples of records are drawn by the National Center for Health Statistics (NCHS) from microfilm copies of the original certificates received from the State registration offices. Other States submit computer tapes to NCHS through the Vital Statistics Cooperative Program (VSCP). For these States the complete file is used. Statistical data for 1984 for both marriages and divorces were provided through the VSCP by eight States—Illinois, Missouri, Nebraska, New York (except New York City marriages), Rhode Island, South Carolina, Vermont, and Virginia. Precoded marriage data were also provided by Florida, Maine, Montana, and New Hampshire.

Marriage and divorce statistics for the United States, for the registration areas, and for individual States are limited to events occurring during the year and registered within the specified area. Interlocutory divorce decrees or decrees "nisi" (which grant that the divorce takes permanent effect at a specific time in the future if the couple does not reconcile in the meantime) are included among the records of the States that grant them, usually for the year in which they were granted. Tabulations are by place of occurrence and include events occurring to nonresidents.

Marriages or divorces of members of the Armed Forces or other U.S. nationals that occur outside the United States are excluded from the tabulations. *United States* refers to the 50 States and the District of Columbia. Alaska has been included in the U.S. tabulations since 1959 and Hawaii, since 1960. Data for Puerto Rico and the Virgin Islands

were compiled for 1984 and preceding years except 1966–69 and 1972. Data for these areas were processed separately from the rest of the MRA and DRA and appear in section 3 of this volume.

Sources of marriage and divorce data since 1867 are shown in table 4-1; a description of these sources can be found in section 7, Volume III, *Vital Statistics of the United States, 1960*.

### COUNTS OF EVENTS

#### Nationwide counts

In 1984 the total counts of marriages by State and county were obtained from central files of marriage records for 47 States and the District of Columbia. Registration officials of New York City supplied the counts for the five boroughs. In the States without central files—Arizona, New Mexico, and Oklahoma—counts were obtained from counties by State officials and reported to NCHS. New Mexico reported the number of premarital health examination forms issued rather than the number of marriages performed. Counts of marriages performed in 1984 were not received from 1 county in Kentucky and 1 county in Ohio.

Beginning with final marriage statistics for 1978, nonlicensed (confidential) marriages registered in California were included in national and geographic totals and rates. Section 4213 of the California Civil Code allows unmarried couples who have been living together to be married confidentially without obtaining a marriage license or health certificate. In 1972 this section was amended to require county clerks to keep sealed records of these marriages and periodically to report the total number to the California State Department of Health Services. Since reporting began, nonlicensed marriages have increased rapidly, from 2,857 in 1973 to 77,391 in 1984.

Total counts of divorces by State and county include decrees of absolute divorce and of annulment as well as decrees of marriage dissolution introduced in many States during the 1970's. These counts were obtained from central files of 46 States and the District of Columbia. Either local or State officials provided the county totals for the four States without central files of divorce records. Local officials in Indiana supplied the county totals. For Indiana counties where no data were provided by local officials, the number of divorces was obtained from the 1984 Indiana

Judicial Report. State officials in Arizona and Oklahoma obtained the county totals and forwarded them to NCHS. State officials in New Mexico supplied the number of petitions filed from court records.

Divorces and annulments in 1984 were not reported for one county or more in the following States: Arkansas (4), Kentucky (5), Louisiana (11), Mississippi (7), Ohio (1), and Texas (3). The number of divorces for some counties in Indiana is based on the number of petitions filed, rather than on the divorce decrees granted.

When marriages or divorces are not reported for counties, the following criteria are applied for the data shown in tables 1-5, 1-6, 1-49, 2-3, 2-36, and 3-2:

1. The State totals are published as reported even when there are nonreporting counties.
2. If the population of nonreporting areas in the latest available census is less than 1 percent of the State population, the State total does not have a footnote to indicate that the data are incomplete.
3. If the population of nonreporting areas is 1.0-9.9 percent of the State population, data for the State and division have the footnote "Data are incomplete." Rates are computed and no estimates are made for the missing data.
4. If the population of nonreporting areas is 10 percent or more of the State population, the State and division totals have the footnote "Data are incomplete," and the marriage or divorce rate is not computed. Estimates are made for inclusion in the totals for the region and the United States, and rates are computed. Figures for the region and United States have the footnote "Figure includes estimates."

These criteria and footnotes apply also to data for standard metropolitan statistical areas shown in tables 1-48 and 2-35.

#### Standard metropolitan statistical areas

The standard metropolitan statistical areas (SMSA's) used in this report (tables 1-48 and 2-35) are those established by the U.S. Office of Management and Budget, using final 1980 census population counts, and used by the U.S. Bureau of the Census except in the New England States.

Except in the New England States, an SMSA is a county or a group of contiguous counties containing a city of 50,000 inhabitants with a total metropolitan population of at least 100,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to specified criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city or cities.

In the New England States the U.S. Office of Management and Budget uses towns and cities rather than counties as geographic components of SMSA's. The National Center

for Health Statistics cannot, however, use the SMSA classification for these States because its data are not coded to identify all towns. Instead, the New England County Metropolitan Areas (NECMA's) are used. These areas are established by the U.S. Office of Management and Budget and are made up of county units.

## DATA FROM MARRIAGE AND DIVORCE CERTIFICATES

### Registration areas

Registration areas for collecting marriage statistics were established in 1957 and for divorce statistics, in 1958. These areas include States with adequate programs for collecting marriage and divorce statistics. Criteria for participation in the registration areas are

1. A central file of marriage or divorce records
2. A statistical report conforming closely in content to the U.S. Standard License and Certificate of Marriage (figure 4-1) or U.S. Standard Certificate of Divorce, Dissolution of Marriage or Annulment (figure 4-2)
3. Regular reporting to the State office by all local areas in which marriages or divorces are recorded
4. Tests for completeness of marriage or divorce registration and completeness of reporting of items on the records carried out in cooperation with NCHS.

In 1984 the MRA (figure 4-3) comprised 42 States, the District of Columbia, the independent registration area of New York City, Puerto Rico, and the Virgin Islands. The DRA (figure 4-4) included 31 States and the Virgin Islands. Table 4-2 shows when States and independent registration areas established central files and when they were admitted to the MRA and DRA.

In the statistical tabulations in this volume, *marriage-registration area* refers only to the 42 States and the District of Columbia. *Divorce-registration area* refers to the 31 States. Marriages in the MRA accounted for 80 percent of all marriages in the United States in 1984, and divorces in the DRA accounted for 48 percent of all divorces.

### Standard certificates

The U.S. Standard License and Certificate of Marriage (figure 4-1) and the U.S. Standard Certificate of Divorce, Dissolution of Marriage or Annulment (figure 4-2), issued by the Public Health Service, serve as the principal means of obtaining comparable data from documents used to collect information on marriages and divorces in the United States. Model reporting forms, prepared in close collaboration with the Public Health Conference on Records and Statistics, were first recommended to the States in 1954 for

adoption January 1, 1955, and stood without revision through 1967.

Revised standard certificates were recommended to the States for use beginning January 1, 1968. A description of the original standard certificate can be found in the Technical Appendix, *Vital Statistics of the United States, 1960*, Volume III; a description of the first revision can be found in the Technical Appendix of the same volume for 1968.

A second revision of each of the standard certificates was recommended to the States for use beginning January 1, 1978. The marriage certificate was revised to include a section providing the license to marry, to request age in addition to date of birth, and to request both the title of the

person performing the ceremony and the type of ceremony (civil or religious) in place of the item for officiant (civil or religious). On the divorce certificate, items requesting person to whom decree was granted and legal grounds for divorce were deleted; the item requesting specification of plaintiff was changed to petitioner; and the items referring to children involved in divorce were changed to request number of children ever born alive of this marriage and children under 18 in this family.

Each State and independent registration area determines the form and content of its vital records. Consequently, the records vary in certain details. Although modified in each State as required by particular needs or by special provisions of the State vital statistics law, the mar-

riage and divorce certificates of most States in the MRA and DRA conform closely to the standard certificates.

Table 4-3 lists items on the U.S. Standard License and Certificate of Marriage and shows which States had the items on their forms in 1984. Table 4-4 shows the same information for the U.S. Standard Certificate of Divorce, Dissolution of Marriage or Annulment.

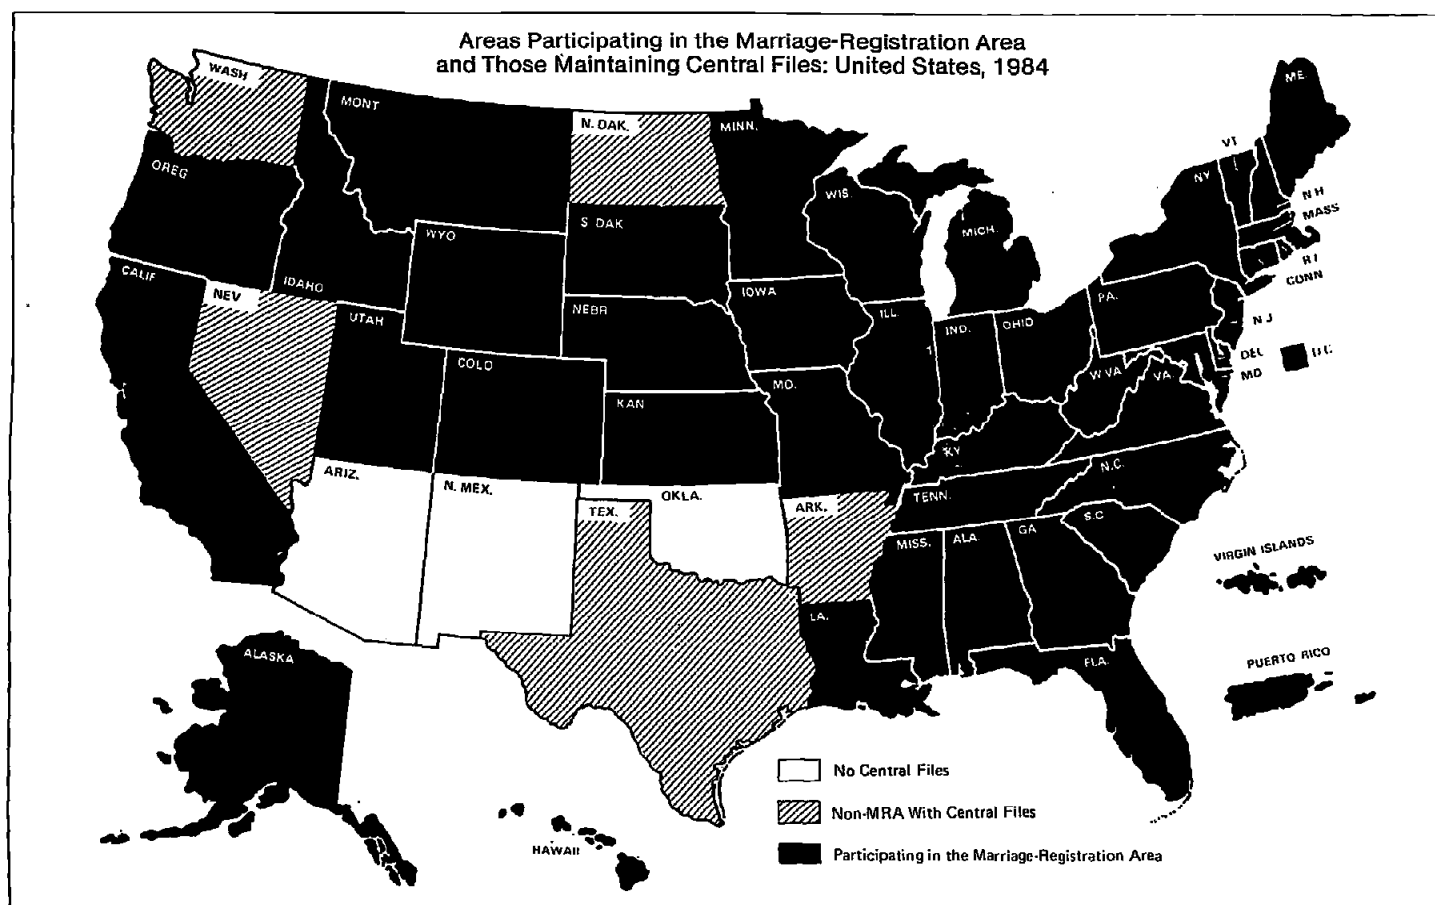

**Area totals**

The estimated totals based on sample data differ slightly from the figures obtained from complete counts of events furnished by the State and local offices. When possible major differences are reconciled before the sample data

are weighted and tabulated. However, even in States where all records are included in the sample, the sample estimate may differ from the State count because of differences between NCHS and State cutoff dates in accepting records.

The sample estimate of marriages in the MRA differed from the complete count in 1984 by 3 percent. It differed by less than 3 percent in all States except California, which differed by 34 percent. In California, nonlicensed marriages were not available for inclusion in the MRA marriage sample (see earlier discussion in "Nationwide counts"). The 5-percent sample of California marriages for 1984 was drawn from 150,577 licensed marriages. The corresponding weight for California sample records was based on this total. Because no information is available on the characteristics of persons obtaining nonlicensed marriages, no estimate is

FIGURE 4-3.

available for the bias introduced in sample estimates by the omission of these marriages.

The sample estimate of divorces in the DRA differed from the complete count by less than 0.4 percent. It differed by less than 3 percent in all States except Georgia where it differed by 8 percent.

#### Characteristics of marriages and divorces

The general rules used to classify and code items for marriages and divorces are set forth in *NCHS Instruction Manual*, Parts 6 and 7, respectively, for 1984. The classification of certain important items is discussed below.

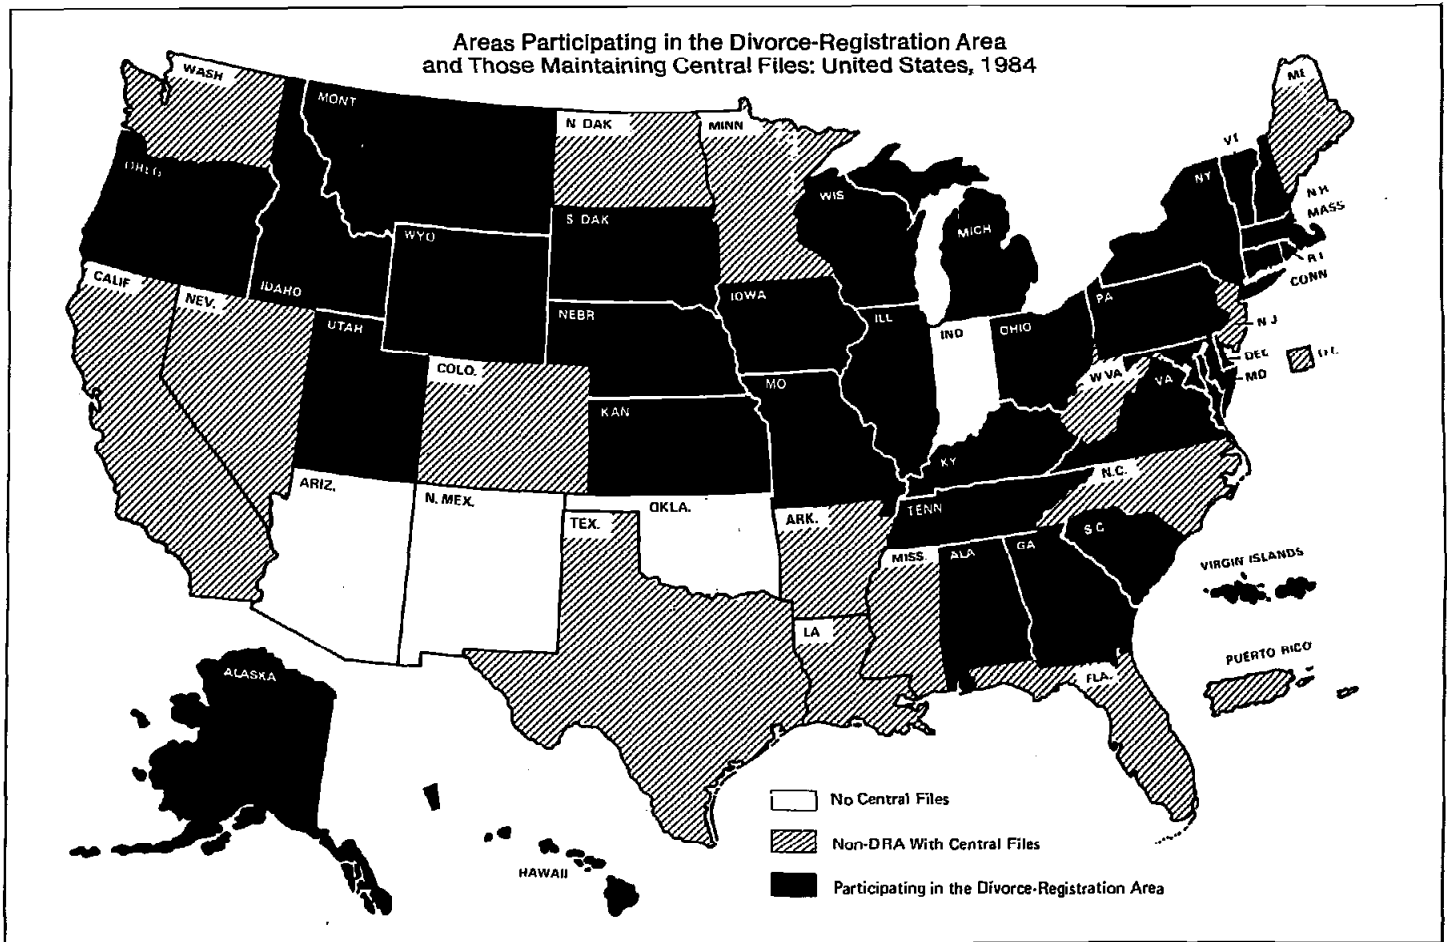

The dates of birth, marriage, separation, and divorce are used to calculate the age at marriage, interval to remarriage, age at divorce, duration of marriage, duration of marriage to separation, and duration of separation to decree. The State of marriage, State of residence, and State of birth are used to derive residency and nativity status.

Information about previous marriages of the spouses is obtained from two items—number of this marriage and previous marital status. First marriages and remarriages (referred to as marriage order) can be identified if either item is stated. The District of Columbia and 34 States requested

both items on their marriage certificates. Colorado, Idaho, Maryland, and Oregon requested only previous marital status. For these States the number of not-stated cases for the number of this marriage was reduced by the number of cases assumed to be first marriages because previous marital status was stated as single. Michigan and Ohio requested only the number of times previously married. Not-stated cases for previous marital status were reduced by the number of persons assumed to be single because they had been previously married "0" times. South Carolina requested number of this marriage. Not-stated cases were reduced by those assumed single because the number was "1." Both items—previous marital status and number of this marriage—were removed from the Iowa marriage certificate July 1, 1976.

The number of States reporting interval to remarriage increased from 18 in 1970 to 27 in 1984. However, during that time, a few States either stopped reporting this information or stopped and then resumed reporting.

During computer processing of the marriage data, values were allocated for missing ages of bride and groom. Reporting of these items has been almost 100 percent complete since 1960. No allocation was done during computer processing of divorce data. However, before age-specific divorce rates were calculated, figures for age not stated were distributed.

### Children involved in divorces

To obtain national estimates for 1970-84, the average number of children under 18 years of age per decree for the DRA was multiplied by the national divorce total. From 1965-69 the average number of children per decree was computed for the 16 States that had reported children with a satisfactory degree of completeness in 1965 (Alaska, Hawaii, Idaho, Iowa, Kansas, Michigan, Missouri, Montana, Nebraska, Ohio, Oregon, South Dakota, Tennessee, Virginia, Wisconsin, and Wyoming); the national divorce total was multiplied by this average. This method was also used to revise figures for 1961-64, originally estimated by using a different method. Consequently, data for 1961-64 shown in table 2-11 differ from figures appearing in Volume III, *Vital Statistics of the United States* prior to 1965. In 1960 the estimate was based on sample data for the United States. For earlier years total counts from States reporting the number of children were used to estimate the children involved in divorce for the United States.

The race of a child involved in a divorce is inferred from the race of the husband and wife. When both spouses are in the same racial category, the child is assigned to that category. When the husband is white and the wife is not, the child is assigned to the wife's race. When the husband

is not white, the child is assigned to the husband's race. When the race of only one spouse is stated, the child is assigned to the stated race.

### Sampling procedures

The registration area samples were designed to yield estimates of State totals as well as frequency distributions by characteristics of the spouses. A sampling rate was designated for each of the States so that the selected sample would consist of at least 2,500 records. Five different sampling rates were used—all records, 1/2, 1/5, 1/10, and 1/20. All records were automatically included in the samples for States submitting data through the Vital Statistics Cooperative Program. Overall, about 40 percent of all marriages in the MRA and about 48 percent of all divorces in the DRA were included in the samples for 1984.

The sampling procedures assure for each State a relative variance of 4 percent or less on a 1-percent estimate, that is, on an estimate of a characteristic that comprises 1 percent of the total events in the State. The sampling rates, number of events, and sample cases by State for 1984 are shown in tables 4-5 (marriages) and 4-6 (divorces).

### Sampling errors

Statistics for States where all records were used have no sampling error. For other States each statistic has a sampling error (or standard error) denoted by  $\bar{\sigma}(x)$ . The sampling error is primarily a measure of variation that occurs by chance because a sample of records is surveyed rather than the entire population. The sampling error can be computed because within each State or registration area the probability that a record will be chosen for the sample is known (either all records, 1/2, 1/5, 1/10, or 1/20, as shown in tables 4-5 and 4-6). For about 68 percent of all possible samples of equal size, the estimate from the sample would differ from the value obtained from a complete count by less than the standard error. For about 95 percent of all samples, the difference would be less than twice the standard error.

Sampling errors are shown in table 4-7 for marriages and table 4-8 for divorces. To facilitate comparisons among registration States with widely varying totals of marriages and divorces, the sampling errors for the registration areas and participating States are shown for frequencies expressed as percents of State or registration area totals. For example, table 1-37 shows 18,847 marriages to brides 65 years of age and over in the MRA for 1984. This estimated frequency is about 1 percent of all brides in the MRA (1,904,243). In table 4-7 under the column "1 or 99" in the row for the total MRA the sampling error is 413. Thus chances are about 68 out of 100 that the actual number of marriages to brides 65 years of age and over is within one standard error of the estimate from this particular sample (18,847  $\pm$  413), or between 18,434 and 19,260. The interval from 18,434 to 19,260 is called a 68-percent confidence interval for the actual number of marriages of brides 65 years of age and over. The sampling error of a given frequency of marriages or divorces in a particular State can be calculated from the formula

$$\bar{\sigma}(x_{ij}) = \sqrt{\frac{N_i(N_i - n_i)p_{ij}q_{ij}}{n_i - 1}}$$

where

- $i$  = a State or registration area
- $j$  = a subclass, such as an age group of brides
- $N_i$  = the final count of events reported by State  $i$  (table 1-5 or 2-3)
- $n_i$  = the number of sample records in State  $i$  (table 4-5 or 4-6)
- $p_{ij}$  = estimated proportion of all cases with the characteristic  $j$  to be studied for State  $i$  (shown in table 4-7 or 4-8 as a percent under "1 or 99," "2 or 98," "3 or 97," and so forth)
- $q_{ij} = 1 - p_{ij}$
- $x_{ij} = N_i p_{ij}$ , the estimated frequency of the characteristic under study.

In this formula, when the number of sample records,  $n_i$ , is the same as the total marriages,  $N_i$ , the numerator becomes zero, and there is no sampling error for States that have all their records processed. Because the values of  $p_{ij}$  and  $q_{ij}$  are complementary, their product ( $p_{ij}q_{ij}$ ) remains the same if their values are reversed. For instance, the estimated sampling error for an estimate of 5 percent is the same as the sampling error for 95 percent. Therefore, the sampling error for both values is listed in one column in tables 4-7 and 4-8 under the heading "5 or 95."

For example, to calculate the sampling error for previously widowed Colorado brides

$N_i = 35,072$ , the final count of Colorado marriages (table 1-5)

$n_i = 3,500$ , the number of sample records for Colorado (table 4-5)

$x_{ij} = 1,050$ , the estimated frequency of previously widowed Colorado brides (table 1-29)

$p_{ij}$  = the number of previously widowed Colorado brides expressed as a percent of all marriages:  $1,050/35,072 = 0.03$  or 3 percent

$q_{ij} = 1 - p_{ij} = 0.97$  or 97 percent

and,

$$\bar{\sigma}(1,050) = \sqrt{\frac{35,072(31,572)(.03)(.97)}{3,499}} = 96$$

So chances are 68 out of 100 that the actual number of previously widowed Colorado brides is between 954 and 1,146 (1,050  $\pm$  96).

The estimated sampling error for the MRA can be computed from the formula

$$\bar{\sigma}(x_i) = \sqrt{\sum_{k=1}^{43} \frac{N_k(N_k - n_k)}{n_k - 1} p_{kj}q_{kj}}$$

where

- 43 = the 42 States and the District of Columbia in the MRA
- $N_k$  = the final count of events reported by the  $k$ th MRA State
- $n_k$  = the number of sample records in the same State
- $p_{kj}$  = the estimated percent of all cases in State  $k$  with the characteristic  $j$
- $q_{kj} = 1 - p_{kj}$ .

Using the same formula, sampling errors for the DRA shown in table 4-8 were computed by summing over the 31 States in the DRA.

Many of the tables in this volume show percent distributions rather than frequencies. The sampling error for such a percent can be computed by dividing the sampling

error found in table 4-7 or 4-8 by the estimated total number of events for the area. For example, table 1-11 shows that 3.0 percent of Colorado brides were previously widowed. In table 4-7 under the column "3 or 97" the Colorado sampling error is 96. Divide 96 by 35,000, the estimated number of marriages in Colorado as shown in the stub of the same table. The result is 0.3 percent, the sampling error for an estimated 3 percent of 1984 Colorado marriages. Thus chances are about 68 out of 100 that the actual percent of previously widowed Colorado brides is  $3.0 \pm 0.3$ , or between 2.7 and 3.3 percent.

The following formula is used to compute a sampling error for the proportion of events in a subclass of a subgroup, where the number of events in the subgroup is also subject to sampling error:

$$\bar{\sigma}\left(\frac{x}{y}\right) = \left(\frac{1}{y}\right)\sqrt{\bar{\sigma}^2(x) - \left(\frac{x}{y}\right)^2\bar{\sigma}^2(y)}$$

where

- $y$  = the estimated frequency of the subgroup
- $x$  = the estimated frequency of the subclass of the subgroup
- $\bar{\sigma}(y)$  = the sampling error of  $y$  from table 4-7 or 4-8
- $\bar{\sigma}(x)$  = the sampling error of  $x$  from table 4-7 or 4-8.

To illustrate, for the sampling error for the proportion of all previously married Utah brides who were 45-54 years of age, let

- $x$  = 400 previously married Utah brides who were 45-54 years of age (table 1-33)
- $y$  = 5,650 previously married Utah brides
- $\frac{x}{y} = 0.071$
- $\bar{\sigma}(x) = \bar{\sigma}(400) = 38$  from "2 or 98" in table 4-7, as  $x$  is 0.02 of all Utah brides ( $x/N = 400/17,985 = 0.02$ )
- $\bar{\sigma}(y) = \bar{\sigma}(5,650) = 120$  by interpolation between "25 or 75" and "50" in table 4-7, as  $y$  is 0.31 of all Utah brides ( $y/N = 5,650/17,985 = 0.31$ )

and,

$$\begin{aligned} \bar{\sigma}\left(\frac{x}{y}\right) &= \left(\frac{1}{5,650}\right)\sqrt{38^2 - (.071)^2(120)^2} \\ &= 0.007 \text{ or } 0.7 \text{ percentage points.} \end{aligned}$$

So chances are 68 out of 100 that the actual proportion of previously married Utah brides who were 45-54 years of age is  $0.071 \pm 0.007$ , or between 6.4 percent and 7.8 percent.

The statistical significance of the difference between two proportions may be tested by the following formula:

$$\frac{(x_1/y_1) - (x_2/y_2)}{\sqrt{\bar{\sigma}^2(x_1/y_1) + \bar{\sigma}^2(x_2/y_2)}}$$

where the  $x$ 's and  $y$ 's represent the same subgroups as above, but of two populations, and where the denominator, under the square root sign, represents the sampling error of the difference between the proportions  $x_1/y_1$  and  $x_2/y_2$  shown in the numerator of the formula. If this ratio is 2 or larger, the difference between proportions is considered significant at the 0.05 level.

For example, 7.1 percent of previously married brides in Utah were 45-54 years of age, with a sampling error of 0.7 percentage points. Using the same procedure for previously married brides in Massachusetts, 0.111 or 11.1 percent were 45-54 years of age, with a sampling error of 0.003 or 0.3 percentage point. Substituting these values in the formula above gives the following results:

$$\frac{.111 - .071}{\sqrt{(.003)^2 + (.007)^2}} = \frac{.040}{.008} = 5.0$$

Because the difference between the proportions divided by the sampling error is greater than 2, this difference of 4.0 percentage points between remarried brides in Utah and those in Massachusetts is expected to occur by chance less than once in 20 times; the difference is statistically significant at the 0.05 level.

#### Information not reported

Nonresponse errors in marriage and divorce data may arise from any of the following three sources.

1. The item is not on the certificate of a particular reporting area. For example, the item "color" was removed from the 1971 revision of the Massachusetts marriage record.
2. Sometimes when a State revises its form to include additional items, copies of the old form are used by registration offices until their supply is exhausted.
3. Although the item may be on the form, there may be no response, or the response may be illegible or unusable.

Items not answered for any of these three reasons are tabulated as "not stated." Tables 4-9 and 4-10 show the proportions of not-stated cases for specified characteristics of marriages and divorces for 1984. A major proportion of the not-stated cases for the MRA and DRA was due to the absence of items on some of the reporting forms (not reportable). On the divorce records, personal information (age, race, and so forth) typically has been less completely

reported than information about the dissolved marriage or about the type of decree.

#### Other sources of error

*Inconsistent responses*—Occasionally, for both marriages and divorces, the responses to related items are inconsistent. For example, the previous marital status of the bride or groom, as shown on the marriage certificate, may not be consistent with the stated number of times married or number of this marriage. Such differences are reconciled before tabulation.

*Ambiguous wording of items*—Some of the items are worded so that they do not yield information easily classified in standardized categories. This often leads to errors in classification, most frequently of geographic place names (residence, place of marriage, and place of birth) and of previous marriages.

*Microfilm errors*—Errors in the arrangement of the records received on microfilm in NCHS sometimes occur when numbers on the records are out of sequence, missing, or duplicated, or when records that are not part of the universe being sampled are erroneously included in the file.

*Processing errors*—Errors may arise in coding, keying, or tabulating the data. However, 100 percent of sample coding was verified; data already on computer tape were edited for impossible codes and for inconsistencies.

In general, for most of the data from 1960 onward, the completeness and year-to-year consistency are evidence of the basic reliability and coverage of the marriage- and divorce-registration systems.

### COMPUTATION OF RATES

#### Population bases

The rates shown in this report were computed on the basis of population statistics prepared by the U.S. Bureau of

the Census. Rates for the census years 1940–80 are based on the population enumerated as of April 1 in the censuses of those years. Rates for all other years are based on the estimated midyear (July 1) population for the respective years. Rates are based on population estimates including Armed Forces stationed in the United States but excluding Armed Forces abroad, except divorce rates for 1941–46 which are based on populations including Armed Forces abroad.

Beginning in 1980, rates by previous marital status for the MRA were based on the unmarried population 15 years of age and over rather than 14 years and over, which had been the standard until 1980. Marriages of brides and grooms under 15 years of age were included in data for the MRA totals and the youngest age group.

The resident population for the United States for 1920–84 and for the MRA and DRA for 1957–84 is shown in tables 4-11 and 4-12. The sources for these populations are shown in table A.

The resident population estimate for 1984 for each State is shown in table 4-13. The unmarried population by age, marital status, and sex for the MRA is shown in table 4-14, and the married population by age and sex for the DRA is shown in table 4-15.

Rates for 1971–79, except those by marital status, have been revised based on revised population estimates which are consistent with the 1980 census levels and therefore may differ from rates published in the volumes for those years. The 1980 census counted about 5.5 million more persons than had been estimated for April 1, 1980. The revised estimates for the United States are published by the U.S. Bureau of the Census in the *Current Population Reports*, Series P-25, Number 917. Population estimates by month are based on data published in the *Current Population Reports*, Series P-25, Number 899. Unpublished revised estimates for States were obtained from the U.S. Bureau of the Census.
